Enclosing innovations

Will your enclosure
look like this...

or

...like this
in 12 months time?

With ARCA you are prepared for almost anything. The cabinets are resistant to harsh environments and weather. Chemicals, shocks and impacts are not an obstacle either. ARCA challenges steel and is the ultimate partner for your applications and the solid protector of your valuables.

Invariably the enclosure is the "nutshell", housing expensive and often critical components which must perform in extremely harsh and demanding conditions.

To some specifiers a box is a box. But with so many different enclosure configurations on offer, even a basic housing requires considerable thought.

At the other end of the scale, when a designer is faced with the specification of an enclosure to house and protect a specific device or control system, there is an art to getting the exact enclosure product to fulfil the requirement exactly.

At Fibox, we've made it quick and easy for you to compare by introducing a range of wall mounting cabinets manufactured from a Glass Reinforced Polycarbonate material which for the first time is more than a match for the more established GRP and sheet steel products which dominate the market at present.

It is called Fibox ARCA and with sizes ranging from 300 x 200 to 800 x 600 we can safely claim that the market now has a viable alternative for those OEM's Panel Builders and Installers who are looking for corrosion resistant cabinets which will protect their equipment, however hostile the environment.
